AUTHOR ADDENDUM/CORRECTION

We regret the following oversight in the article, “Non-Celiac Gluten Sensitivity – Where are We Now in 2015?” by Anna Sapone MD PhD, Daniel A. Leffler MD, MS and Rupa Mukherjee MD, which appeared in our June 2015 issue (Vol. XXXIX No. 6, pp. 40-48).

Specifically, under the section “NCGS and IBS” on page 46”, the first sentence reads as follows:

“All 37 subjects had improvement in their GI symptoms on the reduced FODMAPs diet with significant worsening of their symptoms when challenged with gluten or whey protein.”

In that article, the authors state: “In conclusion, these consecutive double-blind, randomized, placebo-controlled, cross-over rechallenge studies showed no evidence of specific or dose-dependent effects of gluten in patients with NCGS placed on a low FODMAP diet.”

Therefore the sentence should have read:

“All 37 subjects had improvement in their GI symptoms on the reduced FODMAPs diet without significant worsening of their symptoms when challenged with gluten or whey protein.”
